

NeutraCon pre-sludge trap

S NeutraCon pre-sludge trap

Integrated in washing areas for pre-cleaning as an open settling basin or as a coarse sludge trap.

The NeutraCon pre-sludge trap is used in washing areas where larger quantities of sediments and solids accumulate in addition to light liquids. The perforated PE drain element also retains suspended matter, grass and grass clippings. The light liquids that accumulate flow into the downstream separating plant. The PE cylinder for the drain element can be removed for cleaning.

Round and rectangular tanks with grating covers are available in various load classes. Pre-sludge traps do not replace the required standard sludge trap upstream of the separator.

The grating cover elements can be driven over by vehicles up to SLW 60. This does not include the Con 200 version.

Capacities: 200 – 2,200 l

Use

- Construction and agricultural machinery washing areas
- Golf courses
- Municipal building yards
- Road maintenance depots
- Agricultural businesses

Advantages at a glance

- + Easy cleaning and disposal
- + Retains coarse floating matter
- + PE drain element perforated for retaining non-liquid light substances
